Chapter 1 Introduction

1.1 Features

The ICD-2002 and ICD-2002L are Vacuum Fluorescent Displays which display 20 columns and 2 lines, and the ICD-1201 is a Vacuum Fluorescent Graphic Display which displays 192x16 dots.

Blue-green fluorescent color is easy on the eyes.

The display panel is movable so that it can be adjusted for the best viewing angle.

The customer display have different height by adjusting the support.

The interface of customer display is RS-232C, with baud rates from 1200 up to 9600bps for ICD-1201 and from 4800 up to 9600bps for ICD-2002/L.

The customer display have provided the pass through function to reduce the cable connection.

The self-test function check the circuit board and performs each function for diagnostic purpose. (ICD-1201)

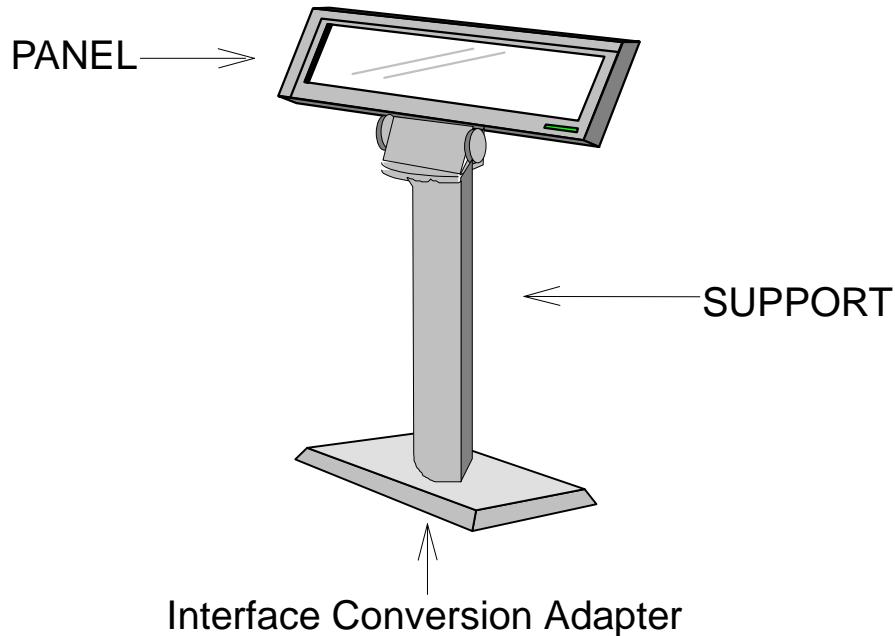

The user defined and international character sets are the standard of customer display.

Chapter 3 Interface

3.1 Interface

Specifications

Data Transmission Method : Asynchronous Serial.
Handshaking : DTR/DSR Control
Default Protocol : 9600bps, non-parity, 8 data bits, 1 stop bit.

Communication Protocol

1. Receive Data.

The DTR signal is as follows:

[HIGH] This indicates that the display isn't ready to receive data.
It depend on the following conditions:

- The period from when the power is turned on to when the printer first becomes ready to receive data.
- When the remaining space in the receiving buffer becomes 128 bytes or less.
- When the DTR signal of the printer is HIGH when the printer is selected using the command.

[LOW] This indicates that the display is ready to receive data.

It depend on the following conditions:

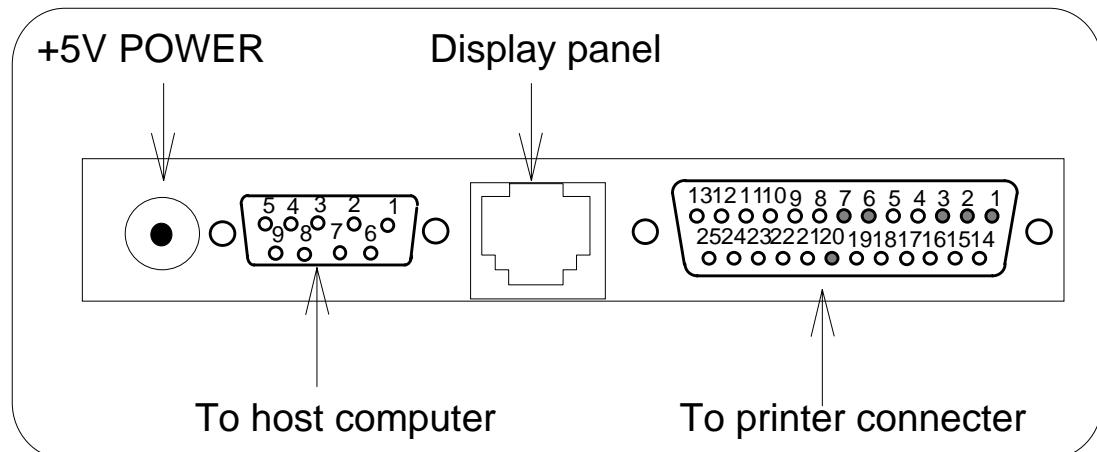

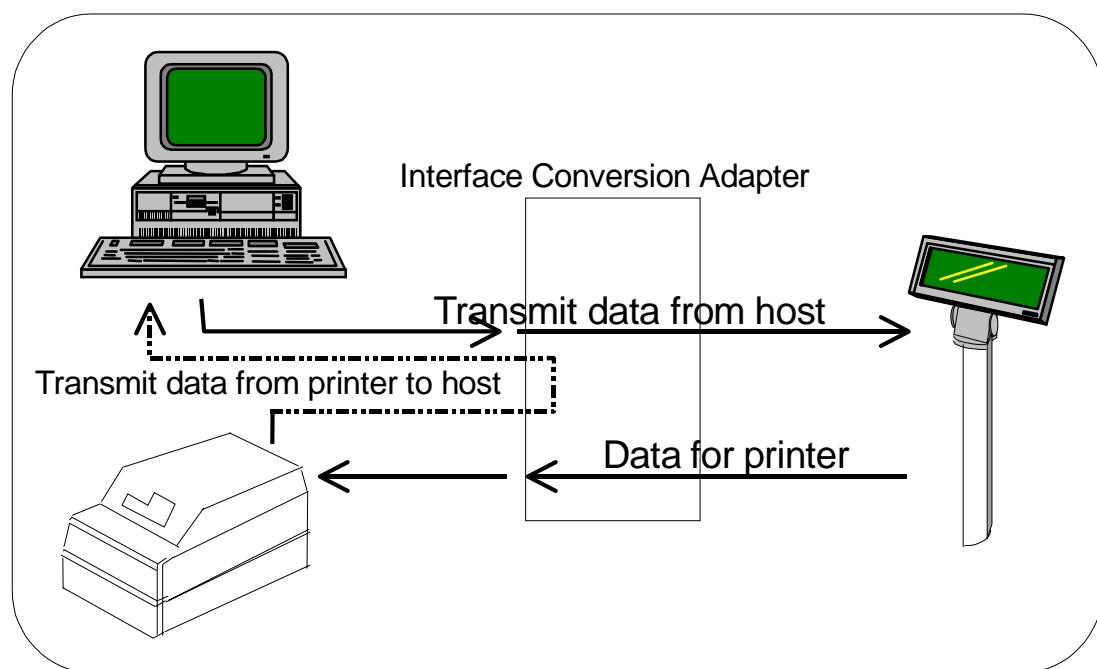

- When the printer first becomes ready to receive data after power-on.
- When the remaining space in the receiving buffer becomes 128 bytes or more.
- When the DTR signal of the printer is LOW when the printer is selected using the command.

2. Transmit Data.

After confirming the DSR is LOW, data is transmitted to printer.

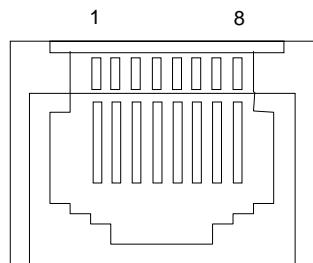

3.2 Interface Conversion Adapter

The interface adapter section has connectors for the display panel, the printer, and the power supply, and host computer. All the data transmitted from the host computer will be received by the display. If this data is for the display, the data will be processed, and if it is for the printer, it will be transmitted to the printer. Whether the data is for the display or the printer can be switched using the peripheral device selection command.

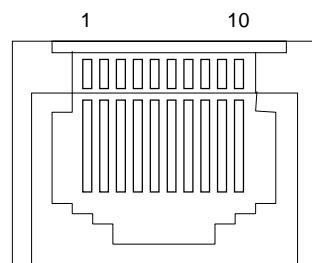

3.3 Connector
